Test Run Report — Run #284

Environment: **Development** • Website: **aepc2-dev.p2agentx.com** • Trigger: Scheduled • Started: Oct 14, 2026 16:49 • Ended: Oct 14, 2026 17:07

Generated: 10/15/2026, 1:23:49 AM

Summary

242	90.5%	219 / 23	0
Total Tests	Pass Rate (excl. skipped)	Passed / Failed	Skipped (connection)

Plant-wise Summary

11 plants

Pass rate is based on completed tests only: passed, failed, and errors. Skipped tests are excluded.

Plant	Environment	Total	Passed	Failed	Errors	Skipped	Pass rate
Abdali_Mall_Barza	Development	22	21	1	0	0	95.5%

Question: How is my data quality for POA and power? How many of them show missing data during daytime or mismatches with satellite prediction?

Error reason: AI indicated failure (matched 'i can't'): I couldn't assess POA and active power data quality because the queried day returned no timeseries data. Result: - Date checked: 2026-10-13 - Status: dataframe empty So I can't calculate:

TECHNICAL EVIDENCE

API call: `GET /testuser2/ai_agent_chat → 200`

I return the Reference Yield for each period, showing peak sun hours or kWh/kWp.\n\n1. I pick data from October 13, 2026, including that day.\n2. I use the active_power column for calculations.\n3. I clean the data by removing or marking any invalid power readings.\n4. For each data point, I calculate energy as (Power × 0.0833 hours), converting units if needed (e.g., from Watts to kW).\n5. I include all days in the calculation.\n6. I add up all the energy values for the selected period and return the total.\n\n1. When you ask about a specific plant detail, like 'power (kW AC)', I:\n2. Look up the plant's metadata, which has all the system information.\n3. Check the 'System' section in the metadata.\n4. Find the 'power (kW AC)' field in that section.\n\n1. I select data from October 13, 2026, including that day.\n2. I find all inverter power columns and their DC rated powers from the plant's metadata.\n3. I set calculation rules, like the irradiance threshold (usually 50 W/m²), power threshold (usually 0.1 kW), and data interval (usually 5 minutes).\n4. For each inverter, I filter the data to times when irradiance is above the threshold, then count the total useful time (T_useful) and downtime (T_down).\n5. I convert these counts to hours based on the data interval."

Question: How did my plant perform yesterday?

Response: No performance metrics are available for yesterday (2026-10-13). The dataset for that date is empty, so energy generation, performance ratio, and related key metrics cannot be retrieved. What the tools returned: - Energy generation by inverter: all 0 kWh, with empty-data status - Specific yield: empty - Performance ratio: NaN/empty - Availability: all inverter values null - Reference yield: empty - Raw timeseries check for inverter active power and pyranometer_1: empty Data status for 2026-10-13: the queried dataframe is empty and does not reach the end date. 01:12 PM Are you satisfied with the answer? Question: Please find out the daily POA poa summed up as a Wh/m^2, daily for the last 12 months and then calculate the median, mean and kurt

Response: Using `pyranometer_1` as the POA sensor, I summed the 5-minute irradiance data into daily POA totals in Wh/m² over the requested last 12 months window. Important note: the available data is incomplete. For this request window, `pyranometer_1` data only exists from 2026-04-05 to 2026-09-11 19:00:00, so the statistics below are based on 160 days, not a full 12 months. Summary statistics of daily POA: - Median: 6943.73 Wh/m² - Mean: 6714.55 Wh/m² - Kurtosis: 8.2525 - Number of daily values used: 160 Daily POA totals (Wh/m²): 2026-04-05: 6704.45 2026-04-06: 6793.26 2026-04-07: 6848.05 2026-04-08: 6760.17 2026-04-09: 4432.46 2026-04-10: 6582.76 2026-04-11: 3884.04 2026-04-12: 4312.05 2026-04-13: 6611.83 2026-04-14: 6873.08 2026-04-15: 7191.16 2026-04-16: 5991.03 2026-04-17: 7068.52 2026-04-18: 6275.19 2026-04-19: 3980.02 2026-04-20: 1524.48 2026-04-21: 4740.04 2026-04-22: 6620.00 2026-04-23: 4896.32 2026-04-24: 5638.57 2026-04-25: 4

Question: How is my data quality for POA and power? How many of them show missing data during daytime or mismatches with satellite prediction?

Response: For today so far (2026-10-14, data available through 15:55), using daytime defined from modelled POA > 20 W/m²: - POA missing during daytime: 0 points - Power missing during daytime: 0 points - POA mismatches vs satellite/modelled POA: 33 points - Power mismatches vs irradiance proxy: 0 points Context: - Daytime points assessed for POA: 109 - Strong-irradiance points assessed for power: 91 - Data status: available up to 2026-10-14 15:55:00, not the full day yet Interpretation: - Missing-data quality is good for both POA and plant power so far today. - POA shows 33 daytime deviations against the satellite/modelled POA benchmark, suggesting either transient sensor disagreement, local cloud effects, or sensor/model bias. - Plant power does not show obvious mismatch against irradiance today under the simple proxy check. 01:27 PM Are you satisfied with the answer? Question: Is there shading happening with my plant? Please analyze the pyranometer and check for frequent dips at certain times

Response: I analyzed the last 30 days of pyranometer data against modelled POA irradiance and looked for recurring time-of-day depressions in measured irradiance. Conclusion: yes, the pattern is consistent with recurring edge-of-day shading or horizon obstruction, not broad midday shading. Key findings - Strongest recurring dips occur in the late afternoon, especially around 17:00–17:35. - There is also a smaller recurring morning dip around 07:25. - Midday irradiance is close to modelled expectations, so there is no clear evidence of significant central-day shading. Most frequent dip times - 17:15 → measured/modelled median ratio 0.367 - 17:10 → 0.369 - 17:20 → 0.375 - 17:25 → 0.375 - 17:05 → 0.381 - 17:30 → 0.385 - 17:35 → 0.385 - 17:00 → 0.400 - 16:55 → 0.414 - 07:25 → 0.421 Hourly pattern of measured/modelled irradiance ratio - 07: 0.430 - 08: 0.534 - 09: 0.717 - 10: 0.877 - 11: 0.992 - 12: 1.030 - 13: 0.988 - 14: 0.875 - 15: 0.705 -

Question: Please find out the daily POA poa summed up as a Wh/m^2, daily for the last 12 months and then calculate the median, mean and kurt

Response: Daily POA irradiance sums over the last 12 months were calculated from `pyranometer_1` by converting 5-minute irradiance values from W/m² to Wh/m² using a factor of 5/60, then summing by day. Summary statistics of daily POA sums: - Median: 6619.67 Wh/m² - Mean: 6082.89 Wh/m² - Kurtosis: -0.2783 - Number of daily sums used: 311 Notes: - The extracted data ends at 2026-10-14 16:25:00, so the last day is partial. - There are also gaps in the 12-month record, so only 311 daily sums were available rather than a full 365/366 days. 01:36 PM Are you satisfied with the answer? Question: How is my data quality for POA and power? How many of them show missing data during daytime or mismatches with satellite prediction?

Response: For 2026-10-13 to 2026-10-14 15:00, using daytime points defined by modelled POA > 20 W/m²: - Daytime points assessed: 81 - POA missing during daytime: 12 points - Power missing during daytime: 2 points - POA mismatches vs satellite/modelled prediction: 64 points - Power mismatches vs satellite/modelled daytime shape: 2 points Notes: - The dataset only extends to 2026-10-14 15:00, not the full current day. - I used modelled_poa_1 as the satellite/modelled POA reference available in the data. - Power mismatch was assessed by comparing normalized active_power shape against normalized modelled POA during daytime. 01:46 PM Are you satisfied with the answer? Question: How can I shut down my inverters?

Response: To shut down your inverter, follow these steps as detailed in the manual: 1. Use the iSolarCloud App to control your inverter. 2. Open the app, log in, and connect to your inverter as described. You may use Bluetooth or scan the QR code on your inverter. 3. Once connected and on the home page, locate the “stop” or shutdown command on the app interface. 4. Issue the shutdown command. The inverter will enter the "Stop" or "Key-stop" state—operation and internal processing will halt. 5. The inverter will remain stopped until you manually start it again from the app. 6. If a critical fault occurs, the inverter stops automatically and the AC relay disconnects. Fault details can be viewed by tapping the alarm icon in the app's power flow chart. Important notes: - The inverter can only pair via Bluetooth with one device at a time. - Use appropriate distributor or service provider credentials if grid support controls are required. - Ensure country/region settings are correct for proper oper

Question: I have a COMMUNICATION_FAULT what do I do to my inverters?

Response: To troubleshoot a COMMUNICATION_FAULT on your inverters, please follow these steps: 1. Check Communication Cable Connections: - Inspect all communication cables between the PV string, inverter, and other devices. Ensure each connection is secure and corresponds to the correct labeled positions. - Reference the system diagram: 2. Inspect the Device Front Panel: - Examine the LED indicators on the front panel (label 1 in the diagram) to determine if a fault is indicated (e.g., red or off status). - Check all buttons and connectors (labels 2 and 3–12) for proper seating and visible damage. - Diagram reference: 3. Confirm Correct Earthing Configuration: - Verify that the earthing system (TN-S, TN-C, TN-C-S, TT, or IT) matches the appropriate transformer points and PE terminals to avoid grounding-related faults. - Diagram reference: 4. Reconnect Signal Cable Connectors: - Use the illustrated step-by-step connector guide to align, insert, and turn connectors

Question: Was there any 0 production days in the last 7 days?

Response: No. There were no 0-production days in the last 7 days (2026-10-08 to 2026-10-14). Daily inverter energy was positive on every day: - 2026-10-08: inverter1 145.07 kWh, inverter2 465.63 kWh, inverter3 428.20 kWh - 2026-10-09: inverter1 139.97 kWh, inverter2 447.95 kWh, inverter3 411.81 kWh - 2026-10-10: inverter1 140.73 kWh, inverter2 454.68 kWh, inverter3 415.71 kWh - 2026-10-11: inverter1 147.43 kWh, inverter2 515.21 kWh, inverter3 486.76 kWh - 2026-10-12: inverter1 148.45 kWh, inverter2 520.35 kWh, inverter3 490.78 kWh - 2026-10-13: inverter1 146.22 kWh, inverter2 505.46 kWh, inverter3 481.19 kWh - 2026-10-14: inverter1 139.13 kWh, inverter2 486.47 kWh, inverter3 463.21 kWh 02:27 PM Are you satisfied with the answer? Question: How is my data quality for POA and power? How many of them show missing data during daytime or mismatches with satellite prediction?

Response: For 2026-10-13 to 2026-10-14 16:00:00: - Daytime points assessed: 254 - Missing POA data during daytime (pyranometer_1): 3 points - Missing power data during daytime (sum of inverter1–3 active power): 0 points - POA mismatches vs satellite/model prediction proxy: 72 points - Power mismatches vs satellite/model prediction proxy: 0 points Method used: - Daytime = zenith < 90° and modelled_poa_1 > 20 W/m² - POA mismatch = pyranometer_1 / modelled_poa_1 < 0.5 or > 1.5 - Power mismatch = modelled_poa_1 > 200 W/m² while summed inverter power < 1000 W Note: the available data currently ends at 2026-10-14 16:00:00, so this is not a full current-day assessment. 02:29 PM Are you satisfied with the answer? Question: How did my plant perform yesterday?

Response: Yesterday (2026-10-13), your plant's top-level view is inverter-level only. Energy produced: - inverter1: 146.22 kWh - inverter2: 505.46 kWh - inverter3: 481.19 kWh - Total across all inverters: 1,132.87 kWh Specific yield: - inverter1: 4.096 kWh/kWp - inverter2: 3.722 kWh/kWp - inverter3: 3.716 kWh/kWp Performance ratio (PR): - inverter1: 0.425 - inverter2: 0.351 - inverter3: 0.528 Availability: - inverter1: NaN - inverter2: NaN - inverter3: NaN Summary: inverter2 and inverter3 produced most of the energy, while inverter1 underperformed on total energy. inverter3 had the strongest PR, inverter2 the weakest. 02:34 PM Are you satisfied with the answer? Question: Is there shading happening with my plant? Please analyze the pyranometer and check for frequent dips at certain times

Response: I found repeated irradiance dips in `pyranometer_1` that are consistent with possible shading windows. Period analyzed: 2026-09-14 to 2026-10-14 Data note: the dataset ends at 2026-10-14 16:00:00, so the current day is only partially covered. Method: compared `pyranometer_1` against `modelled_poa_1` during daylight (`modelled_poa_1 >= 200 W/m²`) and flagged dips where measured irradiance was at least 20% below modelled. Key result: - Flagged dip points: 1961 - Daylight points analyzed: 3341 - About 58.7% of daylight points were flagged, which is too frequent to prove shading by itself; it may also reflect sensor bias/calibration/temperature effects from the reference-cell pyranometer. Most frequent dip windows: - Azimuth 105–120°: about 07:30–09:05, 305 points, median dip 38.6% - Azimuth 120–135°: about 08:35–10:05, 185 points, median dip 23.4% - Azimuth 225–240°: about 13:45–15:05, 256 points, median dip 27.8% - Azimuth 240–255°: about 14:30–16:20, 430 point

Question: Please find out the daily POA poa summed up as a Wh/m^2, daily for the last 12 months and then calculate the median, mean and kurt

Response: I computed the daily POA sums from `pyranometer_1` as Wh/m² by summing 5-minute irradiance samples × 5/60 h. Only 7 of the last 12 months have data available in the database. Available data starts on 2026-04-12 and ends on 2026-10-14 16:00, so months before 2026-04 are unavailable and April/October are partial months. Daily POA statistics by month (Wh/m²): - 2026-04: median 6395.067, mean 5685.439, kurtosis 2.898 - 2026-05: median 6470.492, mean 6259.360, kurtosis 3.089 - 2026-06: median 6641.746, mean 6646.234, kurtosis 0.015 - 2026-07: median 6287.767, mean 6270.264, kurtosis 0.946 - 2026-08: median 6183.483, mean 6135.416, kurtosis -0.503 - 2026-09: median 4939.525, mean 4814.608, kurtosis -1.060 - 2026-10: median 3450.758, mean 3423.442, kurtosis -0.733 Unavailable months in the requested 12-month window: - 2025-10, 2025-11, 2025-12, 2026-01, 2026-02, 2026-03 Notes: - 2026-04 is partial from 2026-04-12 onward. - 2026-10 is partial through 2026-10-14

Question: How can I shut down my inverters?

Response: To shut down your inverter, follow these steps as outlined in the manual: 1. Log in to your system app. 2. Go to the Home screen, then select Maintenance > Inverter ON/OFF. 3. Send a shutdown command from this menu. 4. Locate the DC SWITCH on your inverter (consult the diagram for location), and set the DC SWITCH to OFF. Refer to the inverter component layout here: 5. If you are troubleshooting insulation resistance or other faults, ensure all connectors and cables between the optimizer, PV module, and adjacent components are checked before proceeding with further diagnostics. 6. Use the system diagram for reference on PV string, inverter, and AC distribution unit connections during shutdown. System diagram: Always follow this sequence to safely shut down the inverter: Maintenance > Inverter ON/OFF > Send shutdown command > set DC SWITCH to OFF. Question: How is my data quality for POA and power? How many of them show missing data during daytime or mismatches with satellite prediction?

Response: Assessed over 2026-10-13 00:00 to 2026-10-14 16:55 (data available up to 16:55 on 2026-10-14). Daytime data quality counts: - Daytime points analyzed: 256 - Missing POA points (pyranometer_1): 3 - Missing power points (sum across all 15 inverter active power channels): 3 Mismatch counts against satellite/model prediction proxy: - POA mismatches (pyranometer_1 vs modelled_poa_1): 84 - Power mismatches (aggregate inverter power vs modelled POA proxy): 29 Power channels used: - inverter10_active_power - inverter11_active_power - inverter12_active_power - inverter13_active_power - inverter14_active_power - inverter15_active_power - inverter1_active_power - inverter2_active_power - inverter3_active_power - inverter4_active_power - inverter5_active_power - inverter6_active_power - inverter7_active_power - inverter8_active_power - inverter9_active_power Method used: - Daytime = zenith < 90° and modelled_poa_1 > 20 W/m² - POA mismatch = a

Question: Please figure out how much clipping loss was found in the last 6 months broken by inverters, list them down and plot it as well

Response: Total clipping loss per inverter (2026-04-14 to 2026-10-14): - inverter1: 113173.9399 kWh - inverter2: 113873.6011 kWh - inverter3: 113858.1494 kWh - inverter4: 113572.4137 kWh - inverter5: 95282.6211 kWh - inverter6: 113868.3824 kWh - inverter7: 113881.2973 kWh - inverter8: 113868.3824 kWh - inverter9: 112759.5192 kWh - inverter10: 95533.9159 kWh - inverter11: 50538.2187 kWh - inverter12: 114060.6107 kWh - inverter13: 114060.6107 kWh - inverter14: 114060.6107 kWh - inverter15: 94599.4127 kWh Note: The clipping-loss API returned a partial result. Due to rate-limit errors on the final data chunk (2026-09-13 to 2026-10-14), these values may be understated for the full 6-month period. I've created a bar chart showing total clipping loss per inverter for the last 6 months. Total clipping loss per inverter (2026-04-14 to 2026-10-14): - inverter1: 113173.9399 kWh - inverter2: 113873.6011 kWh - inverter3: 113858.1494 kWh - inverter4: 113572.4137 k

Question: How did my plant perform yesterday?

Response: Yesterday (2026-10-13), your plant's top-level available view is inverter-level. Overall: - The fleet performed well overall. - Most inverters delivered about 2.04–2.17 MWh each. - Specific yield was mostly around 5.86–6.01 kWh/kWp. - Performance ratio was mostly around 0.76–0.78. - POA irradiance daily average from pyranometer_1 was 262.09 W/m². Best performers: - inverter15: 2080.96 kWh, 6.006 kWh/kWp, PR 0.784 - inverter14: 2169.25 kWh, 5.988 kWh/kWp, PR 0.780 - inverter9: 2157.39 kWh, 5.956 kWh/kWp, PR 0.781 Lowest performers among reporting inverters: - inverter2: 2056.72 kWh, 5.678 kWh/kWp, PR 0.724 - inverter3: 2122.80 kWh, 5.860 kWh/kWp, PR 0.762 - inverter4: 2124.65 kWh, 5.865 kWh/kWp, PR 0.764 Notable issue: - inverter11 returned NaN for energy, specific yield, and PR, indicating missing/unavailable data for that inverter yesterday. All inverters, sorted: - inverter1: 2129.63 kWh, 5.879 kWh/kWp, PR 0.769 - inverter2: 2056.72 kWh, 5.6

Question: Is there shading happening with my plant? Please analyze the pyranometer and check for frequent dips at certain times

Response: I analyzed the last month of 5-minute pyranometer data (2026-09-14 to 2026-10-14 16:55) against modelled POA to look for recurring time-of-day irradiance dips that could indicate shading. Findings: - Strongest recurring dip windows are in the early morning and late afternoon. - Overall median measured/modelled POA ratio: 1.041. - I flagged recurring dips where the ratio is materially below that baseline. Most suspicious recurring times: - 07:15 — median ratio 0.717, low-ratio frequency 52.6% - 07:20 — median ratio 0.841, low-ratio frequency 32.0% - 07:25 — median ratio 0.898, low-ratio frequency 29.6% - 17:15 — median ratio 0.894, low-ratio frequency 34.6% - 17:20 — median ratio 0.857, low-ratio frequency 37.0% - 17:25 — median ratio 0.827, low-ratio frequency 38.5% - 17:30 — median ratio 0.816, low-ratio frequency 37.0% - 17:35 — median ratio 0.800, low-ratio frequency 33.3% - 17:40 — median ratio 0.770, low-ratio frequency 39.1% - 17:45 — median ratio

Question: Please find out the daily POA poa summed up as a Wh/m^2, daily for the last 12 months and then calculate the median, mean and kurt

Response: Daily summed POA from `pyranometer_1` over the requested last 12 months could only be computed for the data actually available. Available data window: - 2026-05-09 10:45:00 to 2026-10-14 16:55:00 - So the 12-month request is incomplete; results below are based on 159 daily values in that available range. Summary statistics of daily summed POA (Wh/m²): - Median: 10,137.17 Wh/m² - Mean: 9,638.84 Wh/m² - Kurtosis: 1.9029 Daily summed POA (Wh/m²): - 2026-05-09: 5513.67 - 2026-05-10: 8749.50 - 2026-05-11: 10391.67 - 2026-05-12: 9233.67 - 2026-05-13: 10041.08 - 2026-05-14: 10073.25 - 2026-05-15: 6948.17 - 2026-05-16: 9748.33 - 2026-05-17: 9177.75 - 2026-05-18: 8215.33 - 2026-05-19: 9160.42 - 2026-05-20: 7635.75 - 2026-05-21: 10173.92 - 2026-05-22: 10097.75 - 2026-05-23: 10162.50 - 2026-05-24: 10796.58 - 2026-05-25: 10817.67 - 2026-05-26: 8859.33 - 2026-05-27: 10436.67 - 2026-05-28: 10813.42 - 2026-05-29: 10558.42 - 2026-05-30: 10

Question: How can I shut down my inverters?

Response: To shut down your inverters, follow these steps as described in the manual: 1. Ensure that the AC connections are normal. 2. Log in to the app, then select Maintenance > Inverter ON/OFF on the home screen and send a shutdown command. 3. Set the DC SWITCH of the inverter to OFF. 4. (For a complete shutdown) Turn off the AC switch, and wait until all LED indicators on the inverter panel turn off. 5. Wait for all inverter LEDs to turn off before performing any further maintenance or disconnection. Notes: - Always ensure you wait for the LEDs to go off to confirm the inverter is completely shut down. - This process is sufficient for both general shutdown and safe maintenance situations. - If shutting down for password resets or fault isolation, do so during low sunlight (morning or evening) for safety. There are no diagrams or image URLs in the manual related specifically to shutdown procedures. Manual reference (PDF): https://manual-aepco-sydney.s3.ap-southeast-2.amazonaws.com/testuse

Question: I have a COMMUNICATION_FAULT what do I do to my inverters?

Response: To troubleshoot a COMMUNICATION_FAULT on your inverters, follow these steps: 1. Verify all terminal connections for communication and fault signal wiring, as shown in the layout. Inspect for loose, unplugged, or incorrectly wired terminals. Refer to this diagram: 2. Inspect relay behavior for normal and fault signaling. When there is a communication fault, confirm that the relay is tripped and the LED indicator is switched ON, indicating a communication or related problem. See the relay and LED indicator arrangement in this diagram: 3. Check the relay's system status in the inverter. Under normal operation, the relay should be closed and the LED indicator lit. For a communication fault, the relay should open, disconnecting the circuit and turning OFF the LED. You can review the relay status and system logic in this diagram: Reference: SG30CX/SG50CX Manual V1.0 (see pages corresponding to image URLs) https://manual-aepco-sydney.s3.ap-southeast-2.amazonaws.com/testuser1/manuals

Question: How is my data quality for POA and power? How many of them show missing data during daytime or mismatches with satellite prediction?

Response: Data quality summary for 2026-10-13 to 2026-10-14 (data available through 2026-10-14 17:55): - Daytime samples assessed: 271 - POA irradiance (`pyranometer_1`): poor overall - Missing during daytime: 4 samples (1.48%) - Mismatch vs satellite/model POA (`modelled_poa_1`): 167 samples (89.3%) - Plant active power (`active_power`): fair overall - Missing during daytime: 5 samples (1.85%) - Mismatch vs predicted daytime behavior: 1 sample (0.54%) Interpretation: - Active power quality looks broadly usable, with very few daytime mismatch events and a small amount of missing data. - POA quality appears poor because measured POA differs from modelled/satellite-derived POA in most high-irradiance daytime intervals. That usually suggests sensor bias/drift, plane-of-array modelling mismatch, or calibration/alignment differences rather than simple missing data. - The dataset does not extend to the full requested end of day; the latest recorded point is 2026-10-14 1

Question: Is there shading happening with my plant? Please analyze the pyranometer and check for frequent dips at certain times

Response: I analyzed the last month of pyranometer data against modelled POA irradiance and checked whether irradiance deficits repeat at the same clock times, which is a common shading signature. Conclusion: there is no strong evidence of persistent plant shading from the pyranometer. What I found: - Analysis window: 2026-09-14 00:00 to 2026-10-14 17:55 - Daytime points used: 3,256 - I flagged dips where measured pyranometer irradiance was >18% below modelled POA under valid daytime conditions. - There were 0 persistent dip times meeting a strong repeatability threshold. - Morning dip fraction: 10.4% - Afternoon dip fraction: 10.5% Times with the most frequent dips were: - 09:00 dip frequency 19.4% - 09:05 dip frequency 22.6% - 09:10 dip frequency 22.6% - 09:15 dip frequency 19.4% - 09:20 dip frequency 19.4% - 15:45 dip frequency 22.6% - 16:10 dip frequency 22.6% - 16:15 dip frequency 25.8% - 16:20 dip frequency 24.1% - 16:25 dip frequency 28.6% - 16:3

Question: When was the last time the BOM data showed up

Response: I checked the latest available weather/source records. I could not find any timestamp where the `source` field explicitly contained `BOM` in the extracted data window. - Last available data timestamp overall: 2026-10-14 17:55:00 - `source` value at that latest timestamp: 1.0 - BOM-labelled points found in the checked window: 0 So based on this data, there is no identifiable recent timestamp showing BOM-labelled data. If by "BOM data" you mean a different column or encoding scheme, the current extract does not label it clearly as `BOM`. 03:20 PM Are you satisfied with the answer? Question: I have a COMMUNICATION_FAULT what do I do to my inverters?

Response: Troubleshooting steps for COMMUNICATION_FAULT on your inverters (according to the manual): 1. Ensure the energy meter is correctly integrated on the same network as your inverter. Check all wiring and connections as shown in the network configuration diagram. - View diagram: 2. For WLAN (wireless) connections: Try improving the WLAN signal quality by reducing obstacles, moving the inverter or router, or using a WLAN repeater. - Refer to the same network diagram above. 3. For wired Ethernet: Connect the inverter directly to the router (DHCP server) with an Ethernet cable, following the diagram layout. - Same diagram reference: 4. Check network status indicators for both WLAN and Ethernet on the user interface as shown in the diagram. Verify that the connection is established ("No connection" indicates a problem that must be fixed). - Refer to the same diagram for indicator locations. 5. If the fault persists or communication errors are frequent, contact the service depa

Question: Is there shading happening with my plant? Please analyze the pyranometer and check for frequent dips at certain times

Response: I checked the last 30 days of pyranometer data for recurring time-of-day dips that would suggest shading. Result: there is no evidence of recurring shading in the pyranometer data. Key findings: - Analysis window: 2026-09-14 06:00 to 2026-10-14 18:25 - Daytime points reviewed: 4,664 - High-irradiance points used for dip detection: 368 - Pyranometer checked: pyranometer_1 against the median of pyranometers_1 to _7 - Correlation of pyranometer_1 vs fleet median: 1.000 - Mean ratio of pyranometer_1 to fleet median: 1.000 - Median ratio: 1.000 - Dip threshold used: pyranometer_1 < 85% of fleet median during sunny periods - Dip events found: 0 - Recurring shading times found: none Interpretation: - If shading were occurring on this sensor, I would expect repeated depressions at similar times of day relative to the other pyranometers. - Instead, pyranometer_1 tracks the plant-wide pyranometer median essentially perfectly during sunny periods. - Based on thi

Question: How can I shut down my inverters?

Response: To shut down your inverters, follow these steps as specified in the manual: 1. Disconnect the inverter from any voltage sources. Refer to your inverter installation manual for the specific shutdown procedure for your inverter model. 2. Ensure that the PV modules, connected DC cables, and the terminal block for the DC connection are not defective. Inspect all related components and repair or replace as required. 3. If performing maintenance or troubleshooting, ensure issues are addressed before recommissioning the inverter, using the instructions outlined in the inverter installation manual. Important safety consideration: - Danger to life due to electric shock: Always disconnect the inverter from all voltage sources before opening or servicing. - If the inverter displays an insulation error or does not restart after recommissioning, contact Service as directed in the manual. No diagrams were found in the manual section pertaining specifically to inverter shutdown. If a visual refere

Question: I have a COMMUNICATION_FAULT what do I do to my inverters?

Response: To troubleshoot the COMMUNICATION_FAULT on your inverters, follow these steps as outlined in the manual: 1. Ensure all relevant switch positions are as specified (check both "ON" and "OFF" settings as shown in this diagram: https://manual-aepco-sydney.s3.ap-southeast-2.amazonaws.com/testuser1/manuals/STP_110-60_Manual/images/page_0063_diagram_001.png). 2. Inspect all cable connections for completeness and proper attachment. Pay attention to the required number of connections (e.g., 48). See: 3. Confirm all plugs/connectors are inserted fully and oriented correctly. Reference the indicated arrows here: 4. For multi-phase systems, use a multimeter to check voltages between L1, L2, L3, and PE per this diagram: 5. Follow the connector assembly sequence exactly—align top (1), secure middle (2), and connect cable (3): 6. Double-check that the cable connects to the correct port and is completely seated. Visual reference: 7. Confirm cable routing is correct (green checkmark), not in

Question: Please find out the daily POA poa summed up as a Wh/m^2, daily for the last 12 months and then calculate the median, mean and kurt

Response: Daily POA summed over the last 12 months from `pyranometer_1` is calculated in Wh/m² using the 5-minute data as W/m² × 5/60 and then summed by day. Results: - Median daily POA: 5882.45 Wh/m² - Mean daily POA: 5844.69 Wh/m² - Kurtosis: 0.2022 - Number of daily values used: 314 Note: the extracted data ended at 2026-10-14 18:25:00, so the last day is partial. There are also clear data gaps within the 12-month window, which is why only 314 daily values were available rather than a full 365/366 days. 04:03 PM Are you satisfied with the answer? Question: How can I shut down my inverters?

Response: To shut down your inverter, please follow these steps using the provided diagrams for visual reference: 1. Locate the inverter and identify the bottom section where operational switches are placed. Diagram for reference: 2. Find the AC miniature circuit breakers at the bottom of the inverter (see diagram for labeled locations). Switch all AC circuit breakers to the OFF position. 3. Find the DC load-break switches. These are also at the bottom, clearly labeled in the diagram. Turn all DC switches to the OFF position. 4. Ensure that all switches are set to the OFF position – you can confirm by looking at their labeled ON/OFF positions in the closer view: 5. Wait at least 15 minutes before performing any further service actions or restarting the inverter. Safety Note: Only qualified personnel should shut down and restart the inverter. If you encounter a fault you cannot resolve, contact your Service provider. Manual reference: https://manual-aepco-sydney.s3.ap-southeast-2.amazonaws

Question: I have a COMMUNICATION_FAULT what do I do to my inverters?

Response: To troubleshoot a COMMUNICATION_FAULT on your inverters, follow these steps using the referenced diagrams for visual guidance: 1. Check Main Connections: Make sure all main cables and connections are tightly secured and properly installed as shown in the main components diagram. Pay close attention to cable orientation and that each connector is firmly seated. - Diagram: 2. Inspect Internal Parts: Verify the internal components—especially around labeled parts like "IS12H00012"—are correctly aligned and securely fitted as per the configuration diagram. - Diagram: 3. Examine the Fan Section: Locate Fan 1, Fan 2, and Fan 3 using the fan diagram. Check the status indicators and ensure there are no visible signs of malfunction. - Diagram: 4. If Fan 3 is Faulty: Specifically review the wiring and layout for Fan 3, addressing any connection issues as indicated by arrows in the detailed Fan 3 diagram. - Diagram: Manual reference (PDF): https://manual-aepco-sydney.s3.ap-southeast-2

Question: How is my data quality for POA and power? How many of them show missing data during daytime or mismatches with satellite prediction?

Response: For 2026-10-13 daytime only, I assessed POA and plant power data quality using `pyranometer_1`, `modelled_poa_1`, and `active_power`. Results: - Daytime points assessed: 692 - Missing POA measurements during daytime (`pyranometer_1`): 0 - Missing power measurements during daytime (`active_power`): 0 - POA mismatches vs satellite/modelled POA (`pyranometer_1` vs `modelled_poa_1`): 102 - Power mismatches vs POA-based expected power proxy: 106 Notes: - Daytime was defined as `modelled_poa_1 > 20 W/m²`. - POA mismatch count used a relative deviation threshold of 20%. - Power mismatch count used a relative deviation threshold of 25% against a POA-scaled expected power proxy. - This is a plant-level power quality check. I did not assess inverter-by-inverter mismatches here. 04:16 PM Are you satisfied with the answer? Question: How can I shut down my inverters?

Response: To shut down your inverter, follow these steps precisely: 1. If there is no fault currently, send a shutdown command using the app, SmartLogger, or your management system. 2. Turn off the AC switch that is located between the inverter and the power grid. 3. Use a clamp meter to measure the DC current of each PV string input to the inverter. If the reading is higher than 0.01 A, wait until solar irradiance is low (such as at night) so the current drops below 0.01 A; then continue. 4. Open the maintenance compartment door (refer to the diagrams below), install the support strut, and use a multimeter to verify there is no AC voltage present at the AC terminal block—this confirms the AC side is powered off. 5. Set all DC switches of the inverter to OFF. If the DC switches turn off automatically, proceed to the next step. 6. Wait 15 minutes before troubleshooting, inspecting, or repairing the inverter. Diagrams for Reference: - Essential connection points or adjustment screws: - Lifting

Question: I have a COMMUNICATION_FAULT what do I do to my inverters?

Response: The manual addresses the COMMUNICATION_FAULT as either a Communication Abnormal Alarm or Inverter Parallel Communication Alarm. Here are the steps you should follow: 1. Check whether the communication cable and its terminals are abnormal. Inspect for loose, damaged, or unplugged connectors. Correct any abnormal conditions and ensure a reliable connection at the link points between the inverter(s) and the meter or other system devices. 2. Reconnect the communication cable to the device or meter that is showing the alarm. Make sure the cable is properly and firmly inserted into its respective terminals. 3. If the fault continues after you have verified and re-seated all communication cables and terminals, contact Sungrow Customer Service for further diagnosis. Note: The information in the manual does not reference specific wiring diagrams or provide image URLs related to this alarm, so no diagram-specific guidance can be provided. Manual reference: https://manual-aepco-sydney.s3.ap-so

Question: How is my data quality for POA and power? How many of them show missing data during daytime or mismatches with satellite prediction?

Response: For 2026-10-13 to 2026-10-14 19:25, the data quality metrics are: - Daytime data points evaluated: 268 - POA missing during daytime: 0 - AC power missing during daytime: 0 - POA mismatches vs satellite/modelled POA: 101 - AC power mismatches vs modelled expectation: 158 Notes: - The query returned data up to 2026-10-14 19:25:00, which is the latest available record before refresh, not necessarily a fault. - Daytime was defined as pyranometer_1 > 20 W/m² or modelled_poa_1 > 20 W/m². - POA mismatch rule: absolute difference > 150 W/m² and relative difference > 30% versus modelled_poa_1. - AC power mismatch rule: expected power was estimated from the 95th percentile of active_power/modelled_poa_1; mismatch if absolute difference > 5000 W and relative difference > 35%. 04:40 PM Are you satisfied with the answer? Question: When was the last time the BOM data showed up

Response: I couldn't find any BOM-labelled records in the available `source` data for 2026-10-13 to 2026-10-14. In that window, the latest available timestamp in the dataset is 2026-10-14 19:55:00, but none of those rows had `source` containing `BOM`. So the last time BOM data showed up is: not present in the queried window. Latest available data timestamp overall: 2026-10-14 19:55:00. 05:01 PM Are you satisfied with the answer? Question: How can I shut down my inverters?

Response: To shut down your inverters, follow these steps as detailed in the manufacturer manual: 1. Locate the digital input (DI) and power ground (PGND) terminals inside the inverter. These are shown in this wiring diagram: 2. Connect a passive stop switch between the DI and PGND terminals. Ensure the connections are secure and exactly as indicated in the following diagram: 3. For installations with multiple inverters connected in a daisy chain, wire the passive stop switch according to the setup in this diagram (connecting each inverter's DI and PGND for proper signal transmission): 4. After confirming all wiring, use the passive stop switch to halt inverter operation. Important: Follow the provided diagrams for correct terminal identification. In multi-inverter setups, ensure all connections follow the appropriate diagram for your configuration.
