Clean the data by removing or marking any invalid values in the power column.\n4. For each data point, calculate energy by multiplying the power value by 0.0833 hours (5 minutes), then divide by 1000 to convert from Watts to kilowatt-hours.\n5. Make sure all days in the selected range are included.\n6. Add up all the calculated energy values for the total energy during this period.\n\n1. Choose data from October 11, 2026 (including that day).\n2. Find all inverter power columns and their DC rated power values from the plant information.\n3. Set calculation rules, such as an irradiance threshold (usually 50 W/m²), a power threshold (usually 0.1 kW), and a data interval (typically 5 minutes).\n4. For each inverter, filter the data to only include times when irradiance is above the threshold, then count the number of useful and downtime intervals.\n5. Convert these counts into hours based on the data interval.\n6. Calculate Technical Availability for each inverter using: (useful time - downtime) / useful time × 100.\n7. Return a dictionary showing the availability percentage for each inverter.\n\n1. Choose data from October 11, 2026 (including that day).\n2. Identify the columns for power, irradiance, and temperature.\n3. Clean the data by removing or marking invalid values in the power and irradiance columns.\n4. Calculate the actual energy produced by multiplying power by the time interval (0.0833 hours) and adjusting units as needed.\n5. Calculate the expected energy without adjusting for temperature.\n6. If the system is bifacial, apply extra corrections using metadata like ground reflectivity, area normalization, and shading losses.\n7. Group the actual and expected energy values by day.\n8. Calculate the performance ratio for each day, including bifacial corrections if needed.\n9. Return the performance ratio for each day as a detailed breakdown.\n10. Limit the performance ratio values to a maximum of 1.3 to avoid unrealistic results.\n\n1. Choose data from October 11, 2026 (including that day).\n2. Group the data by the desired time period (minute, hour, day, month, or year).\n3. Make sure all days in the selected range are included.\n4. Calculate the total energy produced during the period using the plant's power data and the 0.0833-hour interval.\n5. Normalize the total energy by dividing by the plant's installed capacity (rated power) to get the specific yield in kWh per kWp.\n6. Return the specific yield for each time period as a detailed breakdown."

Question: Is there shading happening with my plant? Please analyze the pyranometer and check for frequent dips at certain times

Error reason: AI indicated failure (matched 'i cannot'): I analyzed the last 31 days of pyranometer data against modelled POA and checked for recurring time-of-day/solar-angle dips. Conclusion: shading is likely occurring, mainly in the late afternoon.

TECHNICAL EVIDENCE

API call: `GET /testuser2/ai_agent_chat → 200`

Raw API response:

```
{
  "result": {
    "user_input": "Is there shading happening with my plant? Please analyze the pyranometer and check for frequent dips at certain time
s",
    "displayed_response": "I analyzed the last 31 days of pyranometer data against modelled POA and checked for recurring time-of-day/so
lar-angle dips.\n\nConclusion: shading is likely occurring, mainly in the late afternoon.\n\nKey findings:\n- The dedicated shading dete
ctor returned: no shading found in its event dataframe.\n- But the pyranometer-vs-model comparison shows a repeatable directional dip:\n
- Overall median pyranometer/modelled-POA ratio: 0.753\n  - Strongest recurring low-ratio azimuth bins:\n    - 250°: median ratio 0.616
over 117 points\n    - 260°: median ratio 0.575 over 75 points\n- The same pattern appears by hour:\n  - 16:00: median ratio 0.582 over
108 points\n  - 17:00: median ratio 0.536 over 34 points\n- 24 of 31 daylight days had a meaningful share of low-ratio periods, so this
is frequent rather than a one-off event.\n\nInterpretation:\n- A repeatable dip concentrated around azimuth 250–260° and hours 16:00–17:
00 is consistent with west-side / late-afternoon shading on the irradiance sensor or nearby field-of-view obstruction.\n- Because the pa
ttern is localized in solar angle/time, it looks more like shading than random sensor noise.\n- The built-in shading tool did not flag p
lant shading events, so the evidence points more strongly to pyranometer shading/obstruction than clear plant-wide array shading.\n\nImp
ortant caution:\n- The baseline pyranometer/modelled ratio is already low overall (~0.75), so there may also be broader sensor bias, cal
ibration drift, tilt mismatch, or persistent optical issues. I cannot assess soiling here.\n\nBottom line:\n- Yes, there is evidence of
frequent recurring afternoon shading-like dips affecting the pyranometer signal, especially around 16:00–17:00 and solar azimuth 250–26
0°.\n- This does not, from this analysis alone, prove significant plant-wide module shading.",
    "coding_response": [

    "urls": [],
    "steps": "1. I filter the data to include only records from October 11, 2026.\n2. I pick out the columns that contain power, irradia
nce, and temperature readings.\n3. I clean up the data by removing or marking any invalid values in the power and irradiance columns.\n
4. I figure out how much energy the plant actually produced by multiplying the power by the time interval (0.0833 hours) and making sure
the units are correct.\n5. I estimate the expected energy output without adjusting for temperature.\n6. If the system uses bifacial pane
ls, I apply extra corrections based on information like ground reflectivity, area, and shading losses.\n7. I sum up both the actual and
expected energy for each day.\n8. I calculate the performance ratio for each day, including bifacial corrections if needed.\n9. I find t
he average performance ratio across all days.\n10. I cap the performance ratio at 1.3 to avoid unrealistic results.\n\n1. I filter the d
ata to include only records from October 11, 2026.\n2. I find all inverter power columns and their DC rated capacities using the plant’s
metadata.\n3. I set calculation rules, like an irradiance threshold (usually 50 W/m²), a power threshold (usually 0.1 kW), and a data in
terval (typically 5 minutes).\n4. For each inverter, I look at periods when irradiance is above the threshold, then count the total usef
ul time and any downtime.\n5. I convert these counts into hours based on the data interval.\n6. I calculate each inverter’s technical av
ailability as: (useful time - downtime) divided by useful time, times 100.\n7. I return a dictionary showing the availability percentage
for each inverter.\n\n1. I filter the data to include only records from October 11, 2026.\n2. I find all inverter power columns and thei
r DC rated capacities using the plant’s metadata.\n3. I clean up the data by removing or marking any invalid values in each inverter’s p
ower column.\n4. For each inverter, I calculate energy by multiplying power by the time interval (0.0833 hours) and adjusting for units
(like dividing by 1000 if the data is in Watts). I do this for each time period you want (day, month, or year).\n5. I include all days i
n the calculation.\n6. I normalize each inverter’s energy output by its DC rated power to get the specific yield in kWh/kWp.\n7. I renam
e the output columns to show they represent specific yield, using the name 'Specific_Yield'.\n8. I return the specific yield values as a
dictionary, organized by the time period and inverter.\n\n1. I filter the data to include only records from October 11, 2026.\n2. I find
all inverter power columns in the data, leaving out columns for reactive power and flags.\n3. I clean up the data by removing or marking
any invalid values in each inverter’s power column.\n4. For each inverter, I calculate energy by

Question: Please find out the daily POA poa summed up as a Wh/m^2, daily for the last 12 months and then calculate the median, mean and kurt

Response: Daily POA summed as Wh/m² from `pyranometer_1` over the requested last 12 months is only partially available. Available data window: - 2026-04-05 to 2026-09-11 - 160 daily values Statistics on the available daily POA sums: - Median: 7040.02 Wh/m² - Mean: 6768.26 Wh/m² - Kurtosis: 8.423 Important note: - The requested 12-month window was 2025-10-12 to 2026-10-12, but the dataset only contains data from 2026-04-05 to 2026-09-11, so these statistics are for the available portion only. Method note: - I used the daily aggregated `pyranometer_1` values and converted daily average irradiance in W/m² to daily summed irradiation in Wh/m² by multiplying by 24. If you want the full 160-day daily series explicitly listed, here it is: - 2026-04-05: 6704.45 Wh/m² - 2026-04-06: 6793.26 Wh/m² - 2026-04-07: 6895.94 Wh/m² - 2026-04-08: 6760.17 Wh/m² - 2026-04-09: 4432.46 Wh/m² - 2026-04-10: 6675.47 Wh/m² - 2026-04-11: 3938.75 Wh/m² - 2026-04-12: 4342.20 Wh/m²

Question: How is my data quality for POA and power? How many of them show missing data during daytime or mismatches with satellite prediction?

Response: For 2026-10-12, assessing daytime points only: - Daytime samples assessed: 134 - Missing POA data during daytime (`pyranometer_1`): 0 - Missing plant power data during daytime (`active_power`): 0 - POA mismatches vs satellite/model prediction (`modelled_poa_1`): 51 - Power mismatches vs daytime irradiance expectation: 0 Notes: - Available data runs from 2026-10-12 00:00 to 2026-10-12 22:55. - I used daytime as `modelled_poa_1 > 20 W/m²`. - POA mismatch was counted when both `|pyranometer_1 - modelled_poa_1| > 150 W/m²` and relative deviation > 30%. - Power mismatch was counted when `modelled_poa_1 > 200 W/m²` but `active_power < 1000 W`. This means missing data is not the issue today; the main data-quality concern is POA disagreement with the satellite/modelled POA. 08:14 PM Are you satisfied with the answer? Question: Is there shading happening with my plant? Please analyze the pyranometer and check for frequent dips at certain times

Response: I analyzed the last month of pyranometer data against modelled POA irradiance and checked whether dips recur at the same times of day. Result: I do not see strong evidence of persistent shading from the pyranometer. What I found: - Period analyzed: 2026-09-12 to 2026-10-12 - Usable daytime points analyzed: 3,463 - Approximate days covered with usable daytime data: 27 - Median pyranometer/modelled-POA ratio: 0.752 - Persistent dip windows detected: none - Morning flagged slots: 0 - Afternoon flagged slots: 0 Notable low-ratio times: - 18:10 had the lowest ratio, but only 4 samples contributed there - 18:05 had 8 samples - Several small deviations appeared around 17:05–17:25 and 07:25–07:45, but these were weak and not large enough to qualify as recurring shading signatures Interpretation: - If fixed-object shading were affecting the pyranometer, I would expect repeatable dip windows at consistent solar times across many days. - That pattern was not de

Question: Please find out the daily POA poa summed up as a Wh/m^2, daily for the last 12 months and then calculate the median, mean and kurt

Response: Daily POA irradiation sums from pyranometer_1 were computed for 2025-10-13 to 2026-10-12 by converting 5-minute POA irradiance (W/m²) to Wh/m² using ×(5/60), then summing by day. Summary statistics over the daily sums: - Median: 6642.54 Wh/m² - Mean: 6098.49 Wh/m² - Kurtosis: -0.2482 Note: the extracted data ends at 2026-10-12 22:55:00, so the last day may be slightly incomplete. Also, some days in the 12-month window are null due to missing sensor data; the statistics were calculated over the non-null daily sums. If you want the full daily table, here it is: 2025-10-13: 7385.27 Wh/m² 2025-10-14: 7229.88 Wh/m² 2025-10-15: 7071.08 Wh/m² 2025-10-16: 6806.43 Wh/m² 2025-10-17: 6494.03 Wh/m² 2025-10-18: 5586.58 Wh/m² 2025-10-19: 6935.20 Wh/m² 2025-10-20: 6790.24 Wh/m² 2025-10-21: 6662.09 Wh/m² 2025-10-22: 6663.76 Wh/m² 2025-10-23: 6418.95 Wh/m² 2025-10-24: 6184.74 Wh/m² 2025-10-25: 6740.76 Wh/m² 2025-10-26: 6648.35 Wh/m² 2025-10-27: 6409.91 Wh/m²

Question: Please find out the daily POA poa summed up as a Wh/m^2, daily for the last 12 months and then calculate the median, mean and kurt

Response: Daily summed POA irradiance over the last 12 months (2025-10-13 to 2026-10-12), using `pyranometer_1`, has been calculated. Summary statistics: - Mean: 6040.10 Wh/m² - Median: 5336.27 Wh/m² - Kurtosis: -1.5582 - Days included: 365 Notes: - The extraction status indicates the dataset ends at 2026-10-12 18:00:00 rather than the full requested end-of-day timestamp, but the daily series includes 2026-10-12. - Daily values were derived from the daily aggregated irradiance series for `pyranometer_1` and converted to Wh/m². If you want the full 365-day daily table pasted inline, I can provide it. 08:41 PM Are you satisfied with the answer? Question: I have a COMMUNICATION_FAULT what do I do to my inverters?

Response: To troubleshoot a COMMUNICATION_FAULT error on your inverters, please follow the steps below using the referenced diagrams: 1. Inspect the communication cable and terminals for any abnormalities, such as loose, disconnected, or wrongly oriented connectors. Ensure reliable contact and correct orientation as shown in this diagram: - Unscrew the swivel nut from the communication terminal as illustrated to check wiring and physical connection. 2. Reconnect the communication cable securely. Ensure the cable is fully seated, with no bent or damaged pins. (Use the same diagram as above for cable seating guidance.) 3. Examine the relay wiring for the fault indicator LEDs. Focus on the COM (Common), NC (Normally Closed), and NO (Normally Open) relay terminal points as shown here: - The LED indicator should be ON for normal operation and OFF if a fault exists. If needed, disconnect/reconnect wiring as shown for the relay and LED circuit. Check all connections for loose or broken wires. 4

Question: Please find out the daily POA poa summed up as a Wh/m^2, daily for the last 12 months and then calculate the median, mean and kurt

Response: Daily POA irradiance sums over the last 12 months (from 2025-10-13 to 2026-10-12) were computed from `pyranometer_1` by summing 5-minute irradiance values converted to Wh/m². Summary statistics of daily POA sums: - Median: 7,283.79 Wh/m² - Mean: 6,960.88 Wh/m² - Kurtosis: -0.9500 - Valid days: 364 Note: one day (`2025-12-12`) was NaN / missing, so it was excluded from the statistics. Also, the extracted data ended at `2026-10-12 23:25:00` rather than `23:55:00`, per the tool status. Daily sums (Wh/m²): 2025-10-13: 7209.92 2025-10-14: 6930.83 2025-10-15: 6817.83 2025-10-16: 6421.00 2025-10-17: 6135.75 2025-10-18: 4820.00 2025-10-19: 6524.17 2025-10-20: 6575.17 2025-10-21: 6271.92 2025-10-22: 6186.58 2025-10-23: 6054.08 2025-10-24: 5254.33 2025-10-25: 6428.67 2025-10-26: 6299.33 2025-10-27: 3025.50 2025-10-28: 5656.25 2025-10-29: 5747.33 2025-10-30: 5582.83 2025-10-31: 5411.08 2025-11-01: 5513.33 2025-11-02: 4835.33 2025-11-03:

Question: How can I shut down my inverters?

Response: To shut down your inverter, please follow the steps below precisely to ensure safety and avoid equipment damage: 1. Disconnect the external AC circuit breaker and secure it against reconnection (see component labeled as "AC circuit breaker" in the site wiring diagram). 2. Rotate the DC switch to the "OFF" position to disconnect all PV string inputs (refer to the "DC switch" component in the control diagram). 3. Wait approximately 25 minutes to allow the inverter's internal capacitors to fully discharge. (Do not open or touch internal components during this period.) 4. Use a current clamp to confirm that the DC cable is current-free. 5. Before performing any further service or dismantling, verify with professional instruments that both voltage and current are absent. All operators should wear protective equipment as indicated in the safety section. 6. If dismantling DC connectors, use an MC4-Evo2 wrench for the locking parts and install waterproof plugs if needed. For inverters with mu

Question: How is my data quality for POA and power? How many of them show missing data during daytime or mismatches with satellite prediction?

Response: For 2026-10-12: - Daytime points assessed: 124 - Daytime missing POA points (pyranometer_1): 0 - Daytime missing power points (sum of inverter1-3 active power): 0 - POA mismatches vs satellite-prediction proxy: 2 - Power mismatches vs satellite-prediction proxy: 0 Notes: - I used modelled_poa_1 as the satellite/model-based POA prediction proxy and defined daytime as modelled_poa_1 >= 50 W/m². - Power was assessed using the summed inverter active power because plant-level active_power is not available. - Available data for the day ends at 2026-10-12 22:00:00, so late-night missing tail data was not counted as a daytime issue. 09:14 PM Are you satisfied with the answer? Question: Please find out the daily POA poa summed up as a Wh/m^2, daily for the last 12 months and then calculate the median, mean and kurt

Response: Using `pyranometer_1` as the POA sensor, I summed the 5-minute irradiance values into daily POA irradiation in Wh/m². Results: - Median daily POA: 6231.88 Wh/m² - Mean daily POA: 5827.84 Wh/m² - Kurtosis of daily POA: 1.2451 Important data-coverage note: - You asked for the last 12 months (2025-10-13 to 2026-10-12), but available `pyranometer_1` data only runs from 2026-04-12 00:00:00 to 2026-10-12 22:00:00. - So these statistics are based on 184 daily values, not a full 12 months. Daily POA totals (Wh/m²): 2026-04-12: 4179.34 2026-04-13: 6496.27 2026-04-14: 6543.98 2026-04-15: 6702.76 2026-04-16: 5521.16 2026-04-17: 7207.08 2026-04-18: 6395.07 2026-04-19: 3950.52 2026-04-20: 1519.08 2026-04-21: 4832.97 2026-04-22: 6928.17 2026-04-23: 5062.22 2026-04-24: 5835.13 2026-04-25: 4872.33 2026-04-26: 5114.72 2026-04-27: 6485.17 2026-04-28: 6737.80 2026-04-29: 6865.51 2026-04-30: 6774.07 2026-05-01: 6749.66 2026-05-02: 6967.80 2026

Question: How is my data quality for POA and power? How many of them show missing data during daytime or mismatches with satellite prediction?

Response: For 2026-10-12 daytime data quality: - Daytime points assessed: 137 - Missing daytime POA points (pyranometer_1): 0 - Missing daytime power points (sum of all 15 inverter active power channels): 0 Mismatch counts: - POA measured vs modelled POA mismatches (>20% relative difference, using modelled_poa_1 >= 200 W/m²): 65 out of 123 comparable daytime points - Power vs irradiance-shape mismatches (normalized total inverter power vs normalized modelled POA, absolute difference >0.25, using modelled_poa_1 >= 200 W/m²): 44 out of 123 comparable daytime points Data completeness note: - The extracted dataset ends at 2026-10-12 22:55:00, so it does not fully reach the requested day end. This is not material for daytime assessment here. Overall assessment: - Completeness is good during daytime for both POA and power: no missing daytime points. - Consistency is mixed: POA shows a relatively high number of mismatches against the modelled/satellite-related irradiance estim

Question: Is there shading happening with my plant? Please analyze the pyranometer and check for frequent dips at certain times

Response: I analyzed the last 30 days of pyranometer data (2026-09-13 to 2026-10-12, 5-min data) against modelled POA and looked for recurring sharp daytime dips. Findings: - Recurrent dip behavior is present: 99 dip points were detected across 3,920 daytime points. - The strongest repeated dip window is 15:00–15:15, seen on 5 different days, with a median deficit of 67.8% versus modelled POA. - Other recurring windows are clustered around midday to late afternoon, especially 12:00–16:45. Most frequent dip windows: - 15:00–15:15: 5 days, median deficit 67.8%, median azimuth 232.4° - 12:00–12:15: 5 days, median deficit 28.1%, median azimuth 167.2° - 16:00–16:15: 4 days, median deficit 50.4%, median azimuth 245.8° - 14:00–14:15: 4 days, median deficit 41.4%, median azimuth 215.9° - 13:00–13:15: 4 days, median deficit 42.6%, median azimuth 192.7° - 16:30–16:45: 3 days, median deficit 59.4%, median azimuth 250.0° - 14:45–15:00: 3 days, median deficit 49.6%, median azimuth 2

Question: How is my data quality for POA and power? How many of them show missing data during daytime or mismatches with satellite prediction?

Response: For 2026-10-12: - Daytime points assessed: 134 - Missing daytime POA data (pyranometer_1): 1 point - Missing daytime plant power data (active_power): 1 point - POA mismatches vs satellite/model prediction: 105 points out of 122 valid daytime comparison points - Power mismatches vs irradiance expectation: 0 points out of 96 valid daytime comparison points Notes: - Daytime was defined as modelled_poa_1 > 20 W/m². - POA mismatch was counted where |pyranometer_1 - modelled_poa_1| / modelled_poa_1 > 20% for points with modelled_poa_1 > 50 W/m². - Power mismatch was counted for daytime high-irradiance periods with unexpectedly near-zero plant power. 10:52 PM Are you satisfied with the answer? Question: Please find out the daily POA poa summed up as a Wh/m^2, daily for the last 12 months and then calculate the median, mean and kurt

Response: I calculated the daily POA sum from `pyranometer_1` as daily Wh/m² using the 5-minute data (`W/m² × 5/60 h`). Important: the requested last 12 months is incomplete in the database. Available data only spans: - Start: 2026-05-01 00:00:00 - End: 2026-10-13 01:25:00 So the statistics below are for the available daily data only. Results: - Number of daily values: 166 - Median daily POA: 7154.42 Wh/m² - Mean daily POA: 6891.88 Wh/m² - Kurtosis: 18.23 Notes: - The final day, 2026-10-13, is partial and currently sums to 0.00 Wh/m² because the current time is very early in the day. - The very high kurtosis indicates a distribution with heavy tails / outlier days, which is consistent with a few unusually low daily totals in the series. If you want the daily series explicitly, it runs from 2026-05-01 to 2026-10-13 and was computed successfully from the available data. 11:00 PM Are you satisfied with the answer? Question: How is my data quality for POA and power? How many of them show missing data during daytime or mismatches with satellite prediction?

Response: For 2026-10-12: - Daytime data points assessed: 136 - Satellite-comparison points assessed: 127 Missing data during daytime: - POA (pyranometer_1): 0 - Plant power (active_power): 0 Mismatch counts with predictions: - POA vs modelled POA (|error| > 20%): 99 - Power vs satellite-based proxy under strong irradiance: 0 Notes: - Daytime was defined as zenith < 90°. - POA mismatch screening used modelled_poa_1 as the prediction reference. - Power mismatch screening counted cases with satellite irradiance >= 200 W/m² but active_power <= 1000 W. 11:11 PM Are you satisfied with the answer? Question: Please find out the daily POA poa summed up as a Wh/m^2, daily for the last 12 months and then calculate the median, mean and kurt

Response: I retrieved the daily POA irradiance series from `pyranometer_1` and computed daily summed irradiation in Wh/m². Important note: the plant does not have the last 12 months of data available. The returned dataset only covers 2026-04-01 to 2026-10-13, so the statistics below are for that incomplete period (196 daily rows). Daily POA irradiation dataset summary (`pyranometer_1`, Wh/m² per day): - Mean: 5478.35 Wh/m² - Median: 5787.81 Wh/m² - Kurtosis (Fisher): 3.8343 Date coverage returned: - Start: 2026-04-01 - End: 2026-10-13 - Days returned: 196 Daily POA irradiation (Wh/m²): 2026-04-01: 1340.96 2026-04-02: 3648.51 2026-04-03: 4473.41 2026-04-04: 5132.93 2026-04-05: 4362.45 2026-04-06: 4437.39 2026-04-07: 4168.85 2026-04-08: 4305.31 2026-04-09: 5567.46 2026-04-10: 5637.33 2026-04-11: 4500.74 2026-04-12: 5393.14 2026-04-13: 5683.54 2026-04-14: 5687.77 2026-04-15: 4390.14 2026-04-16: 5551.00 2026-04-17: 5130.53 2026-04-18: 5338.

Question: I have a COMMUNICATION_FAULT what do I do to my inverters?

Response: To troubleshoot a COMMUNICATION_FAULT on your inverter, follow these manufacturer-approved steps: 1. Identify the communication interface and cable glands on the inverter. See component B in this diagram: 2. Locate the communication ports and their cable glands (element C). Ensure all cables are securely and correctly connected. Diagram: 3. Check the communication cables for correct insertion and that nothing at the communication interface (label B) is loose or improperly attached. Refer again to: 4. If you need to reconnect cables, use a 3.5 mm blade width screwdriver as depicted to open the clamping bracket and insert/remove cables. See step-by-step: 5. Make sure when reconnecting, the stranded wire is visible inside the clamping bracket chamber. Reference: 6. After checking all cables, ensure cable glands are tightly fastened to prevent loose wiring. Important: Only perform these steps when the inverter is safely powered down according to safety procedures. Manual PDF r

Question: How is my data quality for POA and power? How many of them show missing data during daytime or mismatches with satellite prediction?

Response: For 2026-10-12: - Daytime data points assessed: 148 - Missing POA points during daytime: 0 - Missing power points during daytime: 0 - POA mismatches vs satellite/modelled prediction: 90 - Power mismatches vs satellite/modelled prediction: 0 Note: available data ends at 2026-10-12 23:30:00, so the last 25 minutes of the requested day were not present. 11:31 PM Are you satisfied with the answer? Question: Is there shading happening with my plant? Please analyze the pyranometer and check for frequent dips at certain times

Response: I analyzed the last 30 days of 5-minute pyranometer data against modelled POA to look for recurring time-of-day dips consistent with shading. Findings: - Analysis period: 2026-09-13 00:00 to 2026-10-12 23:30 - Daytime points used: 3,321 - Overall median measured/modelled POA ratio: 0.617 - Overall 10th percentile ratio: 0.318 Recurring dip windows detected: 1. 07:00–11:30 - Median ratio in this window: 0.554 - Worst 10th percentile ratio: 0.198 - Mean solar azimuth: 121.5° 2. 13:20–17:45 - Median ratio in this window: 0.568 - Worst 10th percentile ratio: 0.212 - Mean solar azimuth: 239.5° Strongest recurring dip times: - 07:25 → median ratio 0.298, azimuth 100.5° - 17:10 → median ratio 0.304, azimuth 258.5° - 07:10 → median ratio 0.305, azimuth 98.3° - 17:05 → median ratio 0.307, azimuth 257.8° - 07:05 → median ratio 0.310, azimuth 96.6° - 17:15 → median ratio 0.311, azimuth 259.2° - 17:20 → median ratio 0.314, azimuth 2

Question: Please find out the daily POA poa summed up as a Wh/m^2, daily for the last 12 months and then calculate the median, mean and kurt

Response: Daily summed POA from `pyranometer_1` was computed as the daily sum of 5-minute irradiance values converted from W/m² to Wh/m² using a 5/60 h interval. Results for the last 12 months: - Median daily POA: 5889.39 Wh/m² - Mean daily POA: 5863.83 Wh/m² - Kurtosis: 0.2434 - Non-NaN daily values used: 313 days Note: the extracted data ends at 2026-10-12 23:30:00, so the window effectively runs from 2025-10-13 through 2026-10-12. There are also substantial missing-data gaps within the 12-month period, so the statistics are based only on days with available daily sums. Daily summed POA values (Wh/m²) by day: 2025-10-13: 7805.12 2025-10-14: 7731.69 2025-10-15: 7476.02 2025-10-16: 7176.98 2025-10-17: 6800.18 2025-10-18: 5933.94 2025-10-19: 7372.98 2025-10-20: 7502.66 2025-10-21: 5125.38 2025-10-22: 4979.77 2025-10-23: 4908.11 2025-10-24: 4795.81 2025-10-25: 5303.09 2025-10-26: 5082.08 2025-10-27: 5042.70 2025-10-28: 4752.37 2025-10-29: 5161.61

Question: How can I shut down my inverters?

Response: To safely shut down your inverter (such as the Sunny Tripower STP110-60-Core2), follow these steps as per the official manual: 1. Measure the DC current: - Use a clamp meter to confirm the DC current is zero before disconnecting. Diagram: 2. Turn OFF the DC load-break switches: - Locate the four DC load-break switches and turn each switch to the "OFF" position. Visual guide: 3. Remove the DC connectors: - Use a flat-blade screwdriver to release and remove the DC connector as shown. Do not pull the cable directly. See: 4. Verify AC terminals are de-energized: - Use a multimeter to check voltage between L1, L2, L3, and PE. The voltage must read 0.0V before proceeding. See probe placement: Always verify all electrical sources are fully disconnected before performing any work on the inverter. Question: Is there shading happening with my plant? Please analyze the pyranometer and check for frequent dips at certain times

Response: I analyzed the last ~30 days of `pyranometer_1` against `modelled_poa_1`, filtered to daytime, and looked for repeat negative deviations that recur at similar times/solar angles. Findings: - Analysis window used: 2026-09-13 07:08 to 2026-10-12 12:25 - Daytime points analyzed: 17,462 - Detected dip points: 1,128 Most frequent dip times: - 08:50 — 16.7% of observed days, 5 dip points - 08:51 — 16.7%, 5 dip points - 08:32 to 08:43 — each about 13.3%, 4 dip points each - 08:49 — 13.3%, 4 dip points Most affected solar azimuth ranges: - 100°–105°: 13.9% dip frequency, 134 dip points - 105°–110°: 10.1%, 109 points - 110°–115°: 8.3%, 74 points - 260°–265°: 8.9%, 72 points - 265°–270°: 33.3%, 85 points Interpretation: - There is a clear recurring morning dip signature centered around about 08:30–08:51. - The strongest repeat pattern is when solar azimuth is roughly 100°–115°, which is consistent with an east-southeast obstruction causing morning shading

Question: Please find out the daily POA poa summed up as a Wh/m^2, daily for the last 12 months and then calculate the median, mean and kurt

Response: Using `pyranometer_1`, the requested last-12-month window is incomplete. Available data only spans 2026-06-18 06:26 to 2026-10-12 12:25, so the statistics below are based on 117 daily values, not a full 12 months. Daily POA sums (Wh/m²): 2026-06-18: 5550.06 2026-06-19: 5582.87 2026-06-20: 5534.60 2026-06-21: 5384.84 2026-06-22: 5362.41 2026-06-23: 5930.21 2026-06-24: 6045.29 2026-06-25: 5954.96 2026-06-26: 5928.65 2026-06-27: 5715.86 2026-06-28: 5946.42 2026-06-29: 6054.40 2026-06-30: 6075.81 2026-07-01: 6024.64 2026-07-02: 5918.99 2026-07-03: 5944.23 2026-07-04: 5842.28 2026-07-05: 5848.11 2026-07-06: 5780.58 2026-07-07: 5526.66 2026-07-08: 5645.74 2026-07-09: 5274.35 2026-07-10: 5398.20 2026-07-11: 5769.16 2026-07-12: 5707.54 2026-07-13: 5724.53 2026-07-14: 5382.32 2026-07-15: 5602.83 2026-07-16: 5490.31 2026-07-17: 5135.40 2026-07-18: 5392.29 2026-07-19: 5323.18 2026-07-20: 5258.71 2026-07-21: 5065.99 2026-07

Question: Is there shading happening with my plant? Please analyze the pyranometer and check for frequent dips at certain times

Response: I analyzed the last 30 days of pyranometer data against modelled POA and flagged recurring negative deviations during daylight hours as likely shading-type dips. Summary: - Analysis window: 2026-09-13 00:00 to 2026-10-13 02:55 - Daylight points analyzed: 3,816 - Detected dip events: 382 - Note: data currently ends at 2026-10-13 02:55, so today is only partially covered. Times when dips occur most frequently: - Morning cluster: 07:10–08:00, strongest around 07:25–07:40 - Afternoon cluster: 13:35–14:20, strongest around 13:55–14:20 Most frequent 5-minute dip timestamps: - 07:35 — 10 dips - 14:00 — 10 dips - 14:20 — 10 dips - 07:25 — 9 dips - 07:30 — 9 dips - 07:40 — 9 dips - 13:55 — 9 dips - 14:15 — 9 dips - 13:35 — 9 dips - 07:20 — 8 dips - 14:05 — 8 dips - 07:15 — 7 dips - 07:45 — 7 dips - 07:10 — 7 dips - 13:40 — 7 dips By hour, dip frequency is highest at: - 07:00 hour — 83 dips - 08:00 hour — 59 dips - 13:00 hour — 54 dips
