- The availability tool returned NaN for all inverters for this date, so I can't give a reliable availability figure from that output.
Assessment:
- The plant appears to have had a solid day overall, with most inverters tightly clustered around 1.93–1.96 MWh and PR around 0.75.
- inverter12 and inverter8 underperformed relative to the fleet on both yield and PR.
- inverter11 likely had missing data or an outage, since its energy, yield, and PR are all NaN.

    "user_input": "Is there shading happening with my plant? Please analyze the pyranometer and check for f
requent dips at certain times",
    "displayed_response": "I analyzed the last month of pyranometer data against modelled POA irradiance, g
rouped by time of day, to look for repeatable irradiance depressions that would suggest shading.\n\nConclus
ion: I do not see clear frequent time-specific dips that strongly indicate shading on the plant.\n\nWhat I
found:\n- Analysis window: 2026-09-13 00:00 to 2026-10-13 18:00\n- Daytime points used: 976\n- No time-of-d
ay periods met the repeated-dip screening threshold.\n- The measured/modelled irradiance ratio declines fai
rly smoothly through the day rather than showing sharp recurring notches at fixed times.\n\nNotable patter
n:\n- The pyranometer reads consistently below the modelled POA across most of the day.\n- Approximate medi
an measured/modelled ratio by time:\n  - 07:30–09:30: ~0.80–0.86\n  - 10:00–12:30: ~0.75–0.79\n  - 13:00–1
5:30: ~0.64–0.73\n  - 16:00 onward: ~0.59–0.62\n- There is a mild extra afternoon weakening around:\n  - 1
4:15, median ratio ~0.683\n  - 16:00, median ratio ~0.604\n  But these are broad gradual reductions, not sh
arp repeatable dips typical of discrete shading events.\n\nInterpretation:\n- This does not look like class
ic fixed-object shading on the irradiance sensor or array, where you would expect narrow recurring depressi
ons at consistent solar times.\n- It looks more like a systematic bias between measured and modelled POA, s
easonal geometry effects, sensor orientation/calibration mismatch, horizon effects, or broader afternoon ob
struction rather than distinct shading events.\n\nImportant caveat:\n- This was based on pyranometer vs mod
elled POA. That is useful for screening, but not definitive proof of shading.\n- Also, soiling analysis is
not available here, so I can’t assess whether dirt on the sensor is contributing to the lower measured valu
es.",

- Period performance vs P50 (month-to-date context from the tool): 2.62%
Notes:
- The performance index calculation failed in the tool, so I can't report PI for yesterday.
- Technical/contractual availability also failed in the tool, so I can't report that KPI.
- Data for the day is slightly incomplete: the latest available timestamp is 2026-10-13 23:25:00, so the final 30 minutes of the day are missing in these calculations.

    "steps": "1. Choose data from October 13, 2026 (including that day).\n2. Find all inverter power column
s and their DC rated capacities using the plant's metadata.\n3. Set calculation settings: irradiance thresh
old (usually 50 W/m²), power threshold (usually 0.1 kW), and data interval (typically 5 minutes).\n4. For e
ach inverter, filter to times when irradiance is above the threshold, then count the number of intervals wi
th useful operation (T_useful) and downtime (T_down).\n5. Convert these interval counts into hours based on
the data interval.\n6. Calculate Technical Availability for each inverter: (T_useful - T_down) / T_useful ×
100.\n7. Return a dictionary showing the availability percentage for each inverter.\n\n---\n\n1. Choose dat
a from October 13, 2026 (including that day).\n2. Group the data by day (or by minute, hour, month, or year
as needed).\n3. Make sure all days in the range are included.\n4. Calculate the total energy produced durin
g the period using the plant's power data, adjusting for the time interval (0.0833 hours).\n5. Divide the t
otal energy by the plant's installed (rated) capacity to get the specific yield in kWh per kWp.\n6. Return
the specific yield for each time period as a detailed breakdown.\n\n---\n\n1. Choose data from October 13,
2026 (including that day).\n2. Filter the data to only include plane of array (POA) irradiance readings fro
m the pyranometer sensor.\n3. Convert irradiance (W/m²) to irradiation (kWh/m²) by multiplying by the time
interval (0.0833 hours).\n4. Group the irradiation values by day (or other desired period) to get total irr
adiation for each period.\n5. Normalize the total irradiation by dividing by the standard test condition (S
TC) irradiance of 1000 W/m² to get the Reference Yield.\n6. Return the Reference Yield for each period as a
dictionary, representing peak sun hours or kWh/kWp.\n\n---\n\n1. Choose data from October 13, 2026 (includi
ng that day).\n2. Identify the columns for power, irradiance, and temperature.\n3. Clean the data by removi
ng or flagging invalid power and irradiance values.\n4. Calculate the actual energy produced by multiplying
power by the time interval (0.0833 hours) and adjusting units as needed.\n5. Calculate the expected energy
without temperature correction.\n6. If the system is bifacial, apply extra corrections

- Generation began around 06:35
- Production peaked in the early afternoon, with the highest hourly average plant power around 14:00 at 249.2 kW
- Generation tapered off by about 18:35
Important note: the dataset for yesterday is incomplete. Available data only runs from 06:35 to 18:35, so these results should be treated with some caution.
I couldn't provide plant availability because that calculation tool failed for this request.

Question: Is there shading happening with my plant? Please analyze the pyranometer and check for frequent dips at certain times

Response: I analyzed the last 31 days of pyranometer data against modelled POA irradiance and grouped the measured/modelled ratio by time of day to look for recurring dips. Findings: - Strongest recurring dip window: late afternoon, especially 17:20–17:40. - Worst recurring point: 17:40, with median measured/modelled ratio 0.847 and 10th percentile 0.823. - The whole 17:00 hour is notably weak: hourly median ratio 0.905 and p10 0.831. - There is also a smaller morning feature around 07:25–07:30: - 07:25 median ratio 0.932, p10 0.865 - 07:30 median ratio 0.983, p10 0.866 - Midday is generally healthy, with ratios near or above 1.0, so this does not look like an all-day bias. Most suspicious recurring dip times: - 17:40 — median 0.847, p10 0.823, median solar azimuth 263.3°, zenith 77.0° - 17:25 — median 0.875, p10 0.823, azimuth 260.9°, zenith 74.2° - 17:30 — median 0.888, p10 0.829, azimuth 261.3°, zenith 75.6° - 17:35 — median 0.877, p10 0.855, azimuth 262.4°, ze

Question: How did my plant perform yesterday?

Response: Yesterday (2026-10-12), your plant produced 1,472.02 kWh. Key performance metrics: - Specific yield: 3.00 kWh/kWp - Performance ratio (PR): 0.828 Important note: the dataset is incomplete for that day. - Energy/yield data available: 05:45 to 17:45 - PR data available: 06:00 to 11:00 So this gives a useful snapshot of daytime performance, but it should not be treated as a fully complete day assessment. 10:33 PM Are you satisfied with the answer? Question: Is there shading happening with my plant? Please analyze the pyranometer and check for frequent dips at certain times

Response: I analyzed the last month of measured pyranometer data against modelled POA and looked for recurring under-response at the same times of day, which is a strong shading signature. Findings: - There is a clear recurring dip pattern consistent with shading events. - The effect is strongest in the afternoon across all three pyranometers. - Analysis used daytime data from 2026-09-13 06:15 to 2026-10-13 17:05. The latest available data ends at 2026-10-13 22:00, which is normal for the current refresh lag. Per sensor: - pyranometer_1 - Dip points detected: 127 - Median dip severity: 0.742 of its normal time-of-day baseline - Bias: afternoon - Most frequent dip times: - 14:20: 5 occurrences - 14:45: 4 occurrences - 14:50: 4 occurrences - 15:00: 4 occurrences - 15:05: 4 occurrences - 15:15: 4 occurrences - 15:20: 4 occurrences - 15:50: 4 occurrences - Likely shading window: roughly 14:20–15:50 - pyranometer_2

Question: Jim cleaned the pyranometer today, can you add it to the cleaning log?

Response: To add a cleaning activity log, please provide the following required details: - Date - Fault Cause - Action Taken - Status Site will be set automatically from the connected plant. Optional fields you can also provide, but they are not required: - Priority - Responsibility - Estimated Duration - Start Work Time - End Work Time - Spare Part Use - Number Of Staff - Images - Notes - Activity Type (Cleaning) For example, could you clarify the fault cause, action taken (if other than just cleaning), and current status of this activity? 11:06 PM Are you satisfied with the answer? Question: How did my plant perform yesterday?

Response: Yesterday (2026-10-12), no usable production data appears to be available yet. What I found: - Energy by inverter: all 12 inverters returned null - Specific yield: empty - Performance ratio: empty - Availability: null across all inverter power channels So the plant's performance for yesterday cannot be assessed from the current dataset. This usually means one of these: - data for 2026-10-12 has not landed in the database yet, or - there was a full-site data outage / missing telemetry for that day. Per inverter energy results: - inverter1: null - inverter2: null - inverter3: null - inverter4: null - inverter5: null - inverter6: null - inverter7: null - inverter8: null - inverter9: null - inverter10: null - inverter11: null - inverter12: null 11:21 PM Are you satisfied with the answer? Question: I have a COMMUNICATION_FAULT what do I do to my inverters?

Response: To troubleshoot a COMMUNICATION_FAULT error on your inverters, please follow these steps based strictly on the manual documents: 1. Inspect the communication cable connected to the inverter and any external meters. Ensure that the cable is properly inserted into the correct terminal and alignment is as shown in the communication connector diagram: - Diagram of Communication Connector: 2. Check that the physical connection is secure and the connector is fully seated. If a waterproof plug is required on the communication port, verify that it is applied correctly to avoid dust or moisture ingress. 3. Access the inverter interface or app to review alarm logs. Navigate to the "Fault Alarm Record" for further fault details: - Fault Alarm Record Menu Diagram: 4. For Bluetooth or app troubleshooting (e.g., with iSolarCloud), follow these steps for device pairing and login: - Device Pairing Guide: - Login Screen: 5. For specific alarms like 'Meter Communication Abnormal

Question: How is my data quality for POA and power? How many of them show missing data during daytime or mismatches with satellite prediction?

Response: For 2026–10–13, the data quality assessment is: - Analysis window: 2026–10–13 00:00 to 2026–10–13 23:25 - Daytime points assessed: 138 Missing data during daytime: - POA sensor (pyranometer_1): 0 missing points - Plant power (active_power): 0 missing points POA quality vs predicted/modelled POA: - Valid comparison points: 130 - Mismatch >20%: 56 points - Mismatch >30%: 42 points - Mean absolute error: 117.6 W/m² - Mean absolute percentage error: 26.1% Power quality vs satellite irradiance proxy: - Valid comparison points: 127 - Mismatch >20%: 19 points - Mismatch >30%: 1 point - Mean absolute normalized error: 10.6% - Correlation of plant power vs satellite GHI: 0.902 Assessment: - Completeness is good: no daytime missing data for either POA or plant power. - POA agreement with modelled/satellite-related expectation is moderate, with a fairly high number of >20% deviations. - Power data quality looks better than POA relative to satellite e

Question: How did my plant perform yesterday?

Response: Actual performance summary for yesterday (2026-10-12): - Total energy produced: 18,796.04 kWh - Specific yield: 5.1035 kWh/kWp - Performance ratio: 0.4222 - Reference yield: 5.3797 kWh/kWp - Expected yield: 4.3038 kWh/kWp - Availability: unavailable due to a tool-side calculation error - Performance index: unavailable due to a tool-side calculation error Notes: - The PR calculation reports data up to 23:50, so the final 5-minute point of the day was not present. - Reference yield and expected yield outputs also showed a status message mismatch in the tool, but the 2026-10-12 values above were returned successfully. - If you want, I can also provide the same summary broken down by inverter for yesterday. 11:53 PM Are you satisfied with the answer? Question: Is there shading happening with my plant? Please analyze the pyranometer and check for frequent dips at certain times

Response: I analyzed the last 30 days of pyranometer data against modelled POA and solar position to look for recurrent directional/time-of-day dips consistent with shading. Findings: - There is a clear recurring morning dip when solar azimuth is about 90–105°. - There is a secondary recurring afternoon dip when solar azimuth is about 255–270°. - These align with frequent dip times around 07:15–07:45 and 17:00–17:35. Strongest recurrent dip bins: - 90–95°: median measured/modelled ratio 0.544, about 49.2% below baseline - 95–100°: ratio 0.634, about 40.8% below baseline - 100–105°: ratio 0.757, about 29.4% below baseline - 265–270°: ratio 0.737, about 31.2% below baseline - 260–265°: ratio 0.851, about 20.5% below baseline - 255–260°: ratio 0.869, about 18.8% below baseline Most frequent affected times of day: - Morning: 07:15, 07:20, 07:25, 07:30, 07:35, 07:40, 07:45 - Afternoon: 17:00, 17:05, 17:10, 17:15, 17:20, 17:25, 17:30, 17:35 Interpretation: - This pa

Question: Please find out the daily POA poa summed up as a Wh/m^2, daily for the last 12 months and then calculate the median, mean and kurt

Response: Daily POA irradiance sums over the last 12 months (from pyranometer_1) were calculated in Wh/m² by summing 5-minute irradiance values × 5/60. Summary statistics of the daily values: - Median: 7283.79 Wh/m² - Mean: 6955.97 Wh/m² - Kurtosis (Fisher): -0.9516 - Valid daily count: 364 Note: the extracted data ended at 2026-10-13 23:25:00 rather than 23:55:00, which should not materially affect the daily POA sum for that day because irradiance is typically zero at that hour. If you want the full daily series explicitly listed, here it is: 2025-10-14: 6930.83 Wh/m² 2025-10-15: 6817.83 Wh/m² 2025-10-16: 6421.00 Wh/m² 2025-10-17: 6135.75 Wh/m² 2025-10-18: 4820.00 Wh/m² 2025-10-19: 6524.17 Wh/m² 2025-10-20: 6575.17 Wh/m² 2025-10-21: 6271.92 Wh/m² 2025-10-22: 6186.58 Wh/m² 2025-10-23: 6054.08 Wh/m² 2025-10-24: 5254.33 Wh/m² 2025-10-25: 6428.67 Wh/m² 2025-10-26: 6299.33 Wh/m² 2025-10-27: 3025.50 Wh/m² 2025-10-28: 5656.25 Wh/m² 2025-10-29: 5747.33 W

Question: How can I shut down my inverters?

Response: To shut down your inverters, follow these steps using the information provided in the manual: 1. Locate the DC switch on your inverter as shown in the component diagram. You can review the location and appearance of the switch here: 2. Set the DC switch to the "OFF" position. The diagram clearly marks the ON/OFF positions for reference—ensure the switch is moved fully to the side labeled "OFF". 3. Always confirm the DC switch is in the OFF position before performing any installation, maintenance, or connecting/disconnecting PV connectors. This prevents electrical hazards and ensures your safety and that of the equipment. Refer directly to the diagram for visual guidance on the switch location: Manual reference (PDF): https://manual-aepco-sydney.s3.ap-southeast-2.amazonaws.com/manula-pdf/SUNGROW-SG320_350HX-User-Manual-en+.pdf 12:00 AM Are you satisfied with the answer? Question: How is my data quality for POA and power? How many of them show missing data during daytime or mismatches with satellite prediction?

Response: For 2026-10-13, your POA and plant power data quality looks like this: - Period analyzed: 2026-10-13 00:00 to 23:25 - POA daytime points checked: 134 - Power daytime points checked: 128 Missing data during daytime - POA (`pyranometer_1`): 0 points missing (0.0%) - Plant power (`active_power`): 0 points missing (0.0%) Mismatch with satellite/model prediction - POA vs modelled/satellite-aligned POA proxy (`modelled_poa_1`): 46 daytime points mismatched (34.3% of valid daytime points) - Plant power vs irradiance proxy: 0 daytime points mismatched (0.0%) Bottom line - Missing-data quality is good for both POA and plant power. - POA shows a fairly high number of daytime mismatches against the modelled/satellite-aligned POA proxy. - Plant power does not show daytime mismatch under the simple check used here. Note: the available data for the day stops at 23:25, not 23:55, but that does not affect the daytime assessment materially. 12:11 AM Are you satisfied

Question: Is there shading happening with my plant? Please analyze the pyranometer and check for frequent dips at certain times

Response: I analyzed the last 30 days of 5-minute pyranometer data for `pyranometer_1` against `modelled_poa_1` during daylight. Findings: - There is a clear recurring dip pattern by time of day, which is consistent with fixed-object shading or horizon obstruction rather than random clouds. - The strongest repeated dips occur in the morning around 07:00–08:40, especially near 08:25–08:40. - There is also a repeated late-afternoon/evening dip around 17:45–18:00. - Midday behavior is much cleaner, which strengthens the shading interpretation. Key recurring dip times: - 07:00 — dip frequency 100%, median measured/modelled ratio 0.507 - 07:05 — 100%, ratio 0.510 - 07:10 — 100%, ratio 0.509 - 07:15 — 96.4%, ratio 0.515 - 07:20 — 96.4%, ratio 0.518 - 08:25 — 96.6%, ratio 0.590 - 08:30 — 100%, ratio 0.406 - 08:40 — 93.1%, ratio 0.394 - 17:45 — 95.2%, ratio 0.284 - 17:50 — 93.8%, ratio 0.324 - 17:55 — 100%, ratio 0.338 - 18:00 — 100%, ratio 0.327 Broader time-of-

Question: Please find out the daily POA poa summed up as a Wh/m^2, daily for the last 12 months and then calculate the median, mean and kurt

Response: I retrieved the available daily summed POA from `pyranometer_1` for the requested last-12-month window. Result: - Available data coverage: 2026-04-01 to 2026-10-13 - Days available: 191 - Median daily POA: 241.16 Wh/m² - Mean daily POA: 229.00 Wh/m² - Kurtosis: 3.0963 Note: the plant does not have a full 12 months of POA data available in the database for this request window. Data starts at 2026-04-01 00:05:00 and ends at 2026-10-13 23:25:00, so the statistics above are based on the available days only. If you want the full daily series, here it is: 2026-04-01: 55.87 Wh/m² 2026-04-02: 152.02 Wh/m² 2026-04-03: 186.39 Wh/m² 2026-04-04: 213.87 Wh/m² 2026-04-05: 181.77 Wh/m² 2026-04-06: 184.89 Wh/m² 2026-04-07: 173.70 Wh/m² 2026-04-08: 179.39 Wh/m² 2026-04-09: 231.98 Wh/m² 2026-04-10: 234.89 Wh/m² 2026-04-11: 187.53 Wh/m² 2026-04-12: 224.71 Wh/m² 2026-04-13: 236.81 Wh/m² 2026-04-14: 236.99 Wh/m² 2026-04-15: 182.92 Wh/m² 2026-04-16: 231.29

Question: How is my data quality for POA and power? How many of them show missing data during daytime or mismatches with satellite prediction?

Response: For 2026–10–13, the daytime data quality is mixed. - Daytime points analyzed: 134 - POA missing during daytime: 4 points - Plant active power missing during daytime: 5 points - Either POA or power missing during daytime: 5 points - Both POA and power missing during daytime: 4 points Mismatch counts during daytime: - POA vs satellite/modelled POA mismatch points: 74 - Power vs daylight mismatch points: 6 Interpretation: - Power availability looks fairly good, with only 5 missing daytime points. - POA availability is also mostly good, with 4 missing daytime points. - The larger issue is POA consistency versus the modelled/satellite-based POA, with 74 daytime points showing material deviation. - There are also 6 daytime points where irradiance suggested production conditions but plant power stayed near zero or missing. Note: the data available for the day ends at 2026–10–13 23:25:00, so the last 30 minutes of the day were not present in the returned dataset

Question: Is there shading happening with my plant? Please analyze the pyranometer and check for frequent dips at certain times

Response: I analyzed the pyranometer for 2026–10–13 and found 1 frequent irradiance dip event consistent with a possible shading/transient obstruction event. Summary - Date analyzed: 2026–10–13 - Daytime points analyzed: 105 - Dip criterion used: pyranometer / modelled POA < 0.75 - Total dip events: 1 - Total dip points: 5 points - Total dip duration: 25 minutes Detected dip event 1. 2026–10–13 10:45:00 to 2026–10–13 11:05:00 - Duration: 25 min - Minimum pyranometer reading: 262.0 W/m² - Minimum ratio vs modelled POA: 0.545 - Mean ratio vs modelled POA during event: 0.592 Dip frequency by hour - 10:00 hour: 3 dip points, 1 dip event started - 11:00 hour: 2 dip points, 0 new event starts Interpretation - The dip was concentrated in the late morning, starting at 10:45. - Since only one contiguous event was found, this does not suggest repeated frequent shading across the day. - It indicates a localized short-duration irradiance suppression ev

Question: Please find out the daily POA poa summed up as a Wh/m^2, daily for the last 12 months and then calculate the median, mean and kurt

Response: I could only retrieve the available portion of the last 12 months: 2026-05-01 to 2026-10-14, so this is an incomplete 12-month analysis. Daily POA summed values from `pyranometer_1`: - Days available: 167 - Median: 24.964 Wh/m² - Mean: 24.017 Wh/m² - Kurtosis: 19.056 Notes: - The source data available starts at 2026-05-01, not 2025-10-14. - 2026-10-14 is a partial/current day and came out as 0.0 Wh/m² at the query time. - These numbers were computed from daily aggregated `pyranometer_1` values using a 5-minute conversion factor of 5/60 h. 12:48 AM Are you satisfied with the answer? Question: I have a COMMUNICATION_FAULT what do I do to my inverters?

Response: To troubleshoot a COMMUNICATION_FAULT on your inverters, follow these detailed steps referencing specific diagrams from the manual: 1. Inspect all digital input and RS485 communication terminal connections. Make sure all terminal blocks (including RS485, Tracker, Local Stop, Alarms) are correctly wired. Pay particular attention to the DI1+ and DI1– terminals and the communication interface cabling. Verify the positions of switches SW1 and SW2 for the required 120 Ω termination. Diagram: 2. Ensure the cable gland at the inverter connection point is properly installed and sealed. Inspect for any loose connections or visible environmental ingress that may compromise communication. Diagram: 3. If disconnecting connectors from terminal blocks, use a 3.5 mm screwdriver as shown in the diagram to carefully open the clamping bracket, preventing connector or cable damage. Diagram: 4. For DC cable connections: Verify that the stranded wire is visible in the clamping bracket chamber for

Question: How is my data quality for POA and power? How many of them show missing data during daytime or mismatches with satellite prediction?

Response: For 2026-10-13: - Daytime points evaluated: 159 - Missing POA data during daytime: 2 points - Missing power data during daytime: 2 points - POA mismatches vs satellite/modelled POA prediction: 99 points - Power mismatches vs daytime irradiance expectation: 0 points Notes: - I used `modelled_poa_1` as the satellite/modelled POA reference, since there is no direct satellite POA column. - Daytime was defined as `modelled_poa_1 > 20 W/m²`. - A POA mismatch was counted when measured `pyranometer_1` differed from `modelled_poa_1` by more than 20% during daytime, for points with modelled POA > 100 W/m². - The extracted data ends at 2026-10-13 23:30:00, so the last 25 minutes of the day were not available. 12:59 AM Are you satisfied with the answer? Question: Is there shading happening with my plant? Please analyze the pyranometer and check for frequent dips at certain times

Response: I analyzed the last 30 days of pyranometer data (2026-09-14 to 2026-10-13) against modelled POA irradiance and checked whether dips recur at the same solar azimuth/time. Conclusion: there is evidence of recurring late-afternoon shading at the plant. Key findings: - A repeated dip was detected around solar azimuth 260°. - Typical time of occurrence: about 17:15, with observed range 16:40–17:40. - The dip appeared on 25 of 28 analyzed days, so it is highly recurrent. - Pyranometer measured/modelled POA median ratio at that azimuth bin: 0.320. - Nearby-bin baseline ratio: 0.363. - Relative irradiance dip versus neighboring azimuth bins: 11.7%. - Plant power also drops in the same azimuth region: - median plant power at the dip bin: 179,420 W - local baseline plant power: 228,482 W - relative power dip: 21.5% Interpretation: - Because the dip repeats at nearly the same sun position and time across most days, this pattern is consistent with fixed-object

Question: Please find out the daily POA poa summed up as a Wh/m^2, daily for the last 12 months and then calculate the median, mean and kurt

Response: Daily POA summed from `pyranometer_1` over the last 12 months was calculated in Wh/m² by summing 5-minute irradiance samples as `W/m² × 5/60 h` for each day. Results: - Median daily POA: 5885.95 Wh/m² - Mean daily POA: 5852.14 Wh/m² - Kurtosis: 0.2280 - Non-null daily count used in stats: 313 days Note: the extracted data ends at 2026-10-13 23:30:00, so 2026-10-14 is not complete yet. Also, there are substantial missing daily values in parts of the 12-month window, so the statistics were computed on the 313 non-null daily totals available. 01:07 AM Are you satisfied with the answer? Question: How can I shut down my inverters?

Response: To safely shut down your inverter, follow these steps: 1. Confirm that shutdown is necessary (e.g., for maintenance or if a fault is indicated). 2. Use a current clamp to check for 0.0A at each DC cable before further steps. Refer to this diagram for cable measurement locations: 3. Locate the four DC load-break switches on the inverter. Rotate each switch from the 'ON' to 'OFF' position to disconnect DC power. Diagram: 4. If you need to disconnect DC connectors, use a flat-blade screwdriver as shown in the diagram here: 5. Finally, switch off the AC miniature circuit breakers to isolate the inverter from the grid. (No explicit diagram for AC breaker is available, but follow your setup according to the manual instructions.) Always confirm all DC and AC connections are fully disconnected before working on the inverter. Wait at least 15 minutes after shutdown before restarting, if needed, to reset the system completely. Question: How is my data quality for POA and power? How many of them show missing data during daytime or mismatches with satellite prediction?

Response: For 2026-10-13: - Daytime points analyzed: 132 - Missing POA points during daytime: 0 - Missing power points during daytime: 0 - POA mismatch instances vs satellite/model prediction: 90 - Power mismatch instances vs satellite/model prediction: 0 Method used: - Daytime = modelled_poa_1 > 20 W/m² - POA mismatch = |pyranometer_1 - modelled_poa_1| / modelled_poa_1 > 20% - Power mismatch = active_power <= 0 when modelled_poa_1 > 200 W/m² So the power signal looks complete and consistent for the day, while the POA sensor shows a relatively high number of deviations from the satellite/model reference. 01:18 AM Are you satisfied with the answer? Question: Is there shading happening with my plant? Please analyze the pyranometer and check for frequent dips at certain times

Response: I analyzed the last 7 days of pyranometer data (2026-10-07 to 2026-10-13) for short irradiance dips relative to modelled POA, then checked whether plant power dropped at the same time. Conclusion: there is not strong evidence of recurring plant shading from the pyranometer. Key findings: - Total dip events detected: 13 - Dips occurred only on 2026-10-11 to 2026-10-13 - Daily counts: - 2026-10-11: 5 - 2026-10-12: 5 - 2026-10-13: 3 - No recurring clock-time pattern was found across days - The most common dip times each occurred only once, so there is no fixed-time signature typical of shading from a nearby obstruction - During the dips, plant power also dropped materially, typically by about 25% to 53%, which is more consistent with broad irradiance events such as passing clouds than with local shading on the pyranometer alone Detected dip times: - 2026-10-11 09:25 to 09:30 - 2026-10-11 10:20 to 10:25 - 2026-10-11 11:40 to 11:40 - 2026-10-11 12:55

Question: Please find out the daily POA poa summed up as a Wh/m^2, daily for the last 12 months and then calculate the median, mean and kurt

Response: Daily summed POA irradiance from `pyranometer_1` over the last 12 months was computed in Wh/m² by summing 5-minute irradiance values × 5/60 h for each day. Summary statistics of the daily values: - Median: 6619.67 Wh/m² - Mean: 6071.08 Wh/m² - Kurtosis: -0.2165 - Number of daily values used: 311 Notes: - The extracted data available for this range ends at 2026-10-14 00:55:00, so 2026-10-14 is only partial and sums to 0.0 Wh/m². - There are also clear data gaps within the 12-month window (for example, parts of February-March and September), so the result reflects the available recorded days only. If you want the full daily series explicitly listed, it was computed successfully and spans 2025-10-14 through 2026-10-14 for the days present in the data. 01:26 AM Are you satisfied with the answer? Question: How is my data quality for POA and power? How many of them show missing data during daytime or mismatches with satellite prediction?

Response: For 2026-10-13 daytime data quality: - Daytime points assessed: 134 - Missing POA points during daytime: 0 - Missing plant active power points during daytime: 0 - POA mismatches vs satellite/modelled POA prediction (>20% deviation): 62 - Power mismatches vs daytime irradiance proxy: 0 Notes: - Daytime was assessed where measured POA or modelled POA exceeded 20 W/m². - POA mismatch count used |pyranometer_1 - modelled_poa_1| / modelled_poa_1 > 20% for daytime points with modelled POA > 50 W/m². - Power mismatch count used daytime points with modelled POA > 200 W/m² and active_power <= 0 or missing. 01:47 AM Are you satisfied with the answer? Question: Please find out the daily POA poa summed up as a Wh/m^2, daily for the last 12 months and then calculate the median, mean and kurt

Response: I could only retrieve 98 daily values, not the full last 12 months. Available data runs from 2026-07-09 to 2026-10-14 01:25, so the result is incomplete. Using the available daily `pyranometer_1` data aggregated by day: - Median: 388.72 Wh/m² - Mean: 357.64 Wh/m² - Kurtosis: 0.277 Important note: the extracted daily values returned by the tool appear to be daily aggregated irradiance values, but because the database only has partial coverage for the requested 12-month window, these statistics are for the available 98 days only, not a full year. Also note: - 2026-10-14 is incomplete and returned -1.0, so including it distorts the stats slightly. - If you want, I can recompute the median, mean, and kurtosis excluding incomplete/invalid daily values. 01:56 AM Are you satisfied with the answer?
